I work at the front of the product process: find the real problem, test it with the people who have it, then **build and ship it**. Two of the projects below are live and public, source on GitHub.

## SELECTED WORK

### Calm Navigation Companion — live product

2026 — live

**Solo — defined, designed, built, shipped, maintained** · calm-navigation-companion.pages.dev

- Walking navigation that routes for calm rather than speed, for people who find crowds and traffic noise draining. Installs to your phone like an app. No account, public.
- Vanilla HTML/CSS/JS on Cloudflare Pages; routing API proxied server-side through Pages Functions so no key reaches the client. ~15k lines, open source. Maintained since launch; reading my own code back is how I catch what a mockup never surfaces.

### The Return Gap — deposit containers and street waste

2026

**Solo — research, concept, business model** · Amsterdam

- Identified the mechanism behind the problem: the mess is what a **failed search** leaves behind. A bag is opened to find out what is inside, and usually there is nothing.
- Eight street interviews, direct observation, and seven initiatives benchmarked across two countries — all of them acting on the public bin. Concept: catch the containers at the front door instead. Proposed; the pilot has not been run.

### Purylock — smart drying locker

2025 – 2026

**Product manager** · brand partner project via my degree · Dutch weather-gear brand

- Reframed an open brief from rain protection to **post-rain recovery**. Discovery interviews put the whole pain at one moment: arrival.
- A modular dry-locker: warm air dries and sanitises a wet jacket, shoes or umbrella while you work. Costed business-model options, pitched at the end of the project.

### GrandPod — voice device for isolated over-75s

2025 – 2026

**Concept and validation** · team of six

- Made the case against building an app: the users are defined by digital exclusion, so the interface itself was the barrier. Argued for voice-first, AI in the background, a verified human on the other end.
- Generated 26 ideas, put the shortlist to around twenty people, then tested the concept as a filmed simulation shown to older people — a phone menu for the AI, a tissue box for the device.

## EDUCATION

### BA Business Innovation

Sep 2025 – 2029

Amsterdam · taught in English

- Product development, user research, business models, innovation management.

## SKILLS

|           |                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESEARCH  | Discovery interviews · desk research · field observation · problem framing · journey mapping · competitive benchmarking · user validation · evidence synthesis                                                   |
| CONCEPT   | Concept development and selection · prototyping and concept testing · Business Model Canvas · pitching                                                                                                           |
| BUILDING  | HTML, CSS, JavaScript · Git and GitHub · Cloudflare Pages and Functions · PWAs and service workers · accessibility to WCAG AA · working fluently with AI coding tools. Two products live, both maintained by me. |
| LANGUAGES | Italian (native) · English (fluent) · Dutch (developing)                                                                                                                                                         |
